

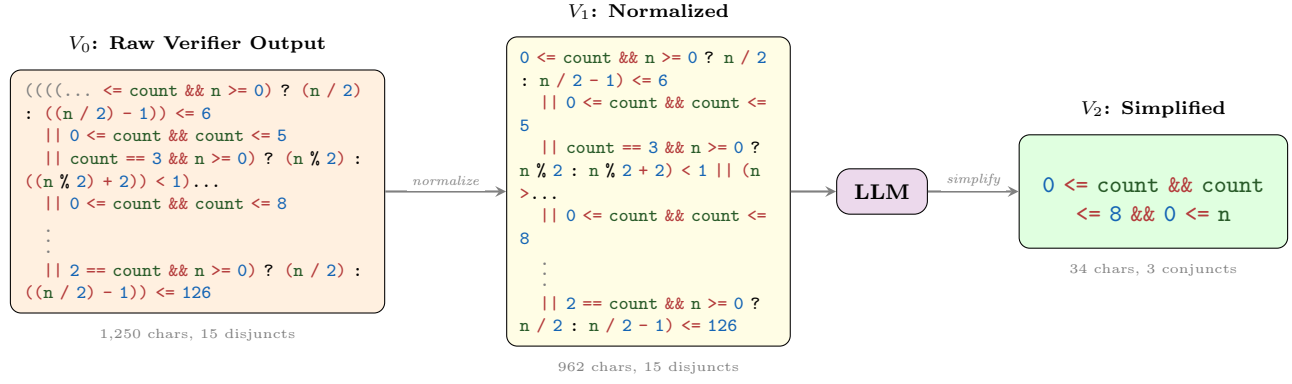

Figure 1: WONDA pipeline on 1679_1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then generalizes bit-count case enumeration to compact numeric bounds (V_2): $0 \leq \text{count} \ \&\& \ \text{count} \leq 8 \ \&\& \ 0 \leq n$, a $37\times$ character reduction with verified correct & sufficient.
