

Figure 1: WONDA pipeline on 2686_1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then replaces per-value case enumeration with a sum-of-squares closed form (V_2): `b == 10 && a < 10 && 6*(c+1) == a*(a+1)*(2*a+1)`, a $9\times$ character reduction with verified correct & sufficient.
