

Figure 1: WONDA pipeline on 274\_1.c. The raw verifier output ( $V_0$ ) is normalized ( $V_1$ ); the LLM then captures the loop’s fixed linear update law and a needed non-negativity bound ( $V_2$ ):  $a + 2*b == 2*n \ \&\& \ 0 \leq b$ , a 248× character reduction with **12.5**× verification speedup.
