

Figure 1: WONDA pipeline on `4828_1.c`. The raw verifier output (V_0) is normalized (V_1); the LLM then removes inert conditional branches and states the combined accumulation in linear form (V_2): $2*(x+y+z) == (a+b+c)*i*(i-1)$, a $132\times$ character reduction with **$35.9\times$** verification speedup.
