

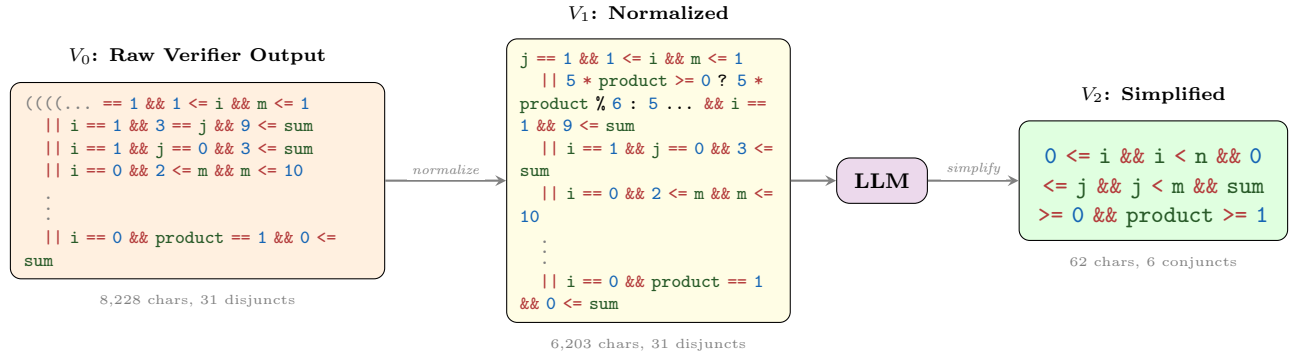

Figure 1: WONDA pipeline on 5066_1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then drops overfitted case constraints and keeps core loop-bound and sign facts (V_2): $0 \leq i \ \&\& \ i < n \ \&\& \ 0 \leq j \ \&\& \ j < m \ \&\& \ sum \geq 0 \ \&\& \ product \geq 1$, a $133\times$ character reduction with $2.6\times$ verification speedup.
