

Figure 1: WONDA pipeline on 6732.1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then eliminates floor-division artifacts in favor of an exact polynomial sum-of-squares identity (V_2): $6 * \text{sum_of_squares} == 2*i*i*i - 3*i*i + i$, a $43\times$ character reduction with $20.4\times$ verification speedup.
