

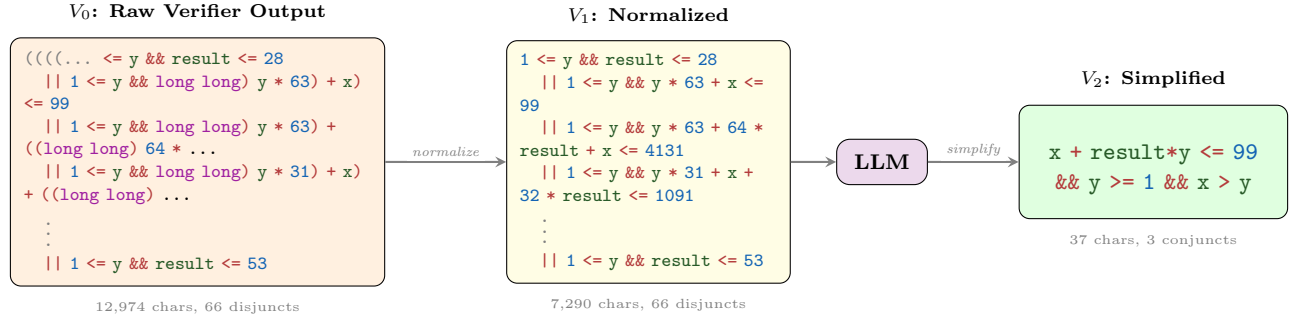

Figure 1: WONDA pipeline on 7158\_1.c. The raw verifier output ( $V_0$ ) is normalized ( $V_1$ ); the LLM then unifies case-specific bounds into one preserved linear combination ( $V_2$ ):  $x + \text{result} \cdot y \leq 99 \ \&\& \ y \geq 1 \ \&\& \ x > y$ , a 351× character reduction with **21.8**× verification speedup.
