

Figure 1: WONDA pipeline on 7321_1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then states the extended-Euclidean Bézout linear equalities without redundant cases (V_2): $A == A0 * x0 + B0 * y0 \ \&\& \ B == A0 * x1 + B0 * y1$, a $24\times$ character reduction with **26.1** $\times$ verification speedup.
