

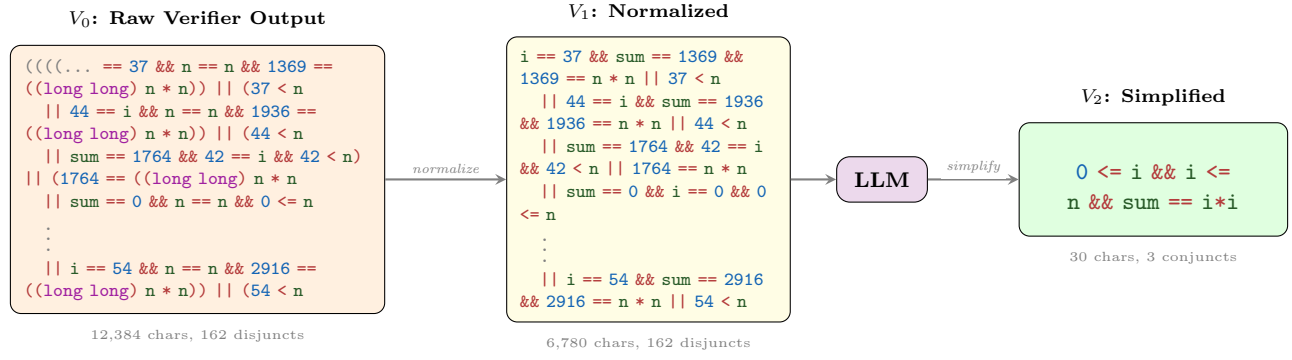

Figure 1: WONDA pipeline on 8694_1.c. The raw verifier output (V_0) is normalized (V_1); the LLM then recognizes the sum-of-odd-integers pattern and states the i^2 closed form (V_2): $0 \leq i \ \&\& \ i \leq n \ \&\& \ \text{sum} == i*i$, a 413× character reduction with **22.5**× verification speedup.
